

Fall 2012 Freshman Cohort Retention Report

Executive Summary

This report summarizes the retention of 1,886 students in the University of South Alabama (USA) Fall 2012 first-time full-time baccalaureate degree-seeking freshman cohort. The retention rate for the Fall 2012 freshman cohort was 68%. Results indicated retention of students with lower high school GPAs and students with lower ACT Composite scores is a concern. As with the Fall 2007, Fall 2008, Fall 2009, Fall 2010, and Fall 2011 cohorts, the orientation session the student attended provided a significant predictor of student persistence. Students attending the earlier Freshman Summer orientation sessions were more likely to persist than students attending the later orientation sessions. As with earlier studies, the importance of awarding freshman scholarships for students was clear. In addition, freshmen who participated in a learning community, lived on campus, or took Freshman Seminar were significantly more likely to return to USA the following year.

Overview

The following report provides a detailed analysis about the retention of the 1,886 first-time full-time baccalaureate degree-seeking freshmen students in the University of South Alabama (USA) Fall 2012 freshman cohort. Retention in the context of this report is defined as whether or not freshmen students persisted and enrolled one year later in the Fall 2013 semester. Similar to reports written by Institutional Research, Planning & Assessment about the Fall 2007, Fall 2008, Fall 2009, Fall 2010, and Fall 2011 freshman cohorts, the input-environment-outcome (IEO) model developed by Alexander W. Astin¹ was used as a conceptual framework to guide this analysis².

Cross tabular results for each variable and whether or not the student returned are reported. Comparisons for each subgroup are made to the overall retention rate of the cohort (68%). Significant mean differences for the input, environmental, and outcome variables are also indicated.

Additionally, three logistic regression models were tested. The first model included the input³ variables. The second model included the input and the environmental⁴ variables. The final model included two outcome⁵ variables. The predictive power of each model for explaining whether or not the student returned (Yes/No) is reported as well as which variables were significant in each of the three models.

Cross Tabular Results

Cross tabular results for each variable and whether or not the student returned are summarized in the following section. Comparisons are made for each subgroup of the variable to the retention rate (68%) of

¹ Astin, A. W. (2002). *Assessment for excellence: The philosophy and practice of assessment and evaluation in higher education*. American Council on Education, Oryx Press.

² University of South Alabama Fall 2007 Freshman Cohort Retention Report available for reference at <http://www.southalabama.edu/irpa/highpriority/fall07cohortfreshretenreport.pdf>

³ Input variables: Gender, race/ethnicity, age, region, high school GPA, and ACT Composite score.

⁴ Environmental variables: Freshman scholarship, other scholarship, housing, learning community, Freshman Seminar, college, and orientation session attended.

⁵ Outcome variables: USA hours earned and USA GPA.

the 1,886 freshmen in the cohort. These comparisons illustrate which subgroups of students persisted at higher, similar, or lower rates than the overall cohort retention rate of 68 percent. In addition, significant mean differences for the input, environmental, and outcome variables are reported.

Input Variable Cross Tabular Results

For the input variables included in this analysis (see Table 1), female students (71%) persisted at a higher rate than male students (64%) and the retention rate mean difference was statistically significant (see Appendix: Independent T-Test Tables). In terms of race/ethnicity, African-American students (66%), Hispanic students (60%), and students included in the “Other” race/ethnicity subgroup⁶ (44%) persisted at a rate lower than the cohort retention rate (68%). The mean difference between retention of Asian students to students in the “Other” race/ethnicity subgroup was statistically significant (see Appendix: ANOVA Tables).

Table 1: Comparisons of Input Variables to Fall 2012 Cohort Retention Rate

Variable	Retention Rate >= 68%	Count	Retention Rate < 68%	Count
<i>*Gender</i>				
	*Female (71%)	1,032	Male (64%)	854
<i>*Race/Ethnicity</i>				
	*Asian (83%)	58	African-American (66%)	468
	Non-Resident Alien (80%)	20	Hispanic (60%)	55
	White (69%)	1,179	Other (44%)	34
	Multiracial (68%)	72		
<i>*Age</i>				
	*18 years old (70%)	1,545	19 years old (57%)	161
	17 years old or younger (70%)	110	20 years or older (49%)	70
<i>Region</i>				
	International (80%)	20	Rest of Alabama (67%)	627
	Mississippi Service Area (74%)	141	Rest of United States (67%)	94
	Mobile or Baldwin County (68%)	912	Florida Service Area (64%)	92
<i>*High School GPA</i>				
	*3.51-4.0 (82%)	818	3.01-3.5 (64%)	559
			2.51-3.0 (52%)	385
			2.5 or lower (49%)	69
<i>*ACT Composite Score</i>				
	24-26 (78%)	415	21-23 (66%)	452
	30 or higher (78%)	116	19-20 (62%)	320
	27-29 (75%)	205	*18 or lower (57%)	247
Note: *Significant mean difference at .05 p level based on Independent T-Test for two group comparisons or at least one group with significant mean difference at .05 p level based on Games-Howell procedure for multiple group comparisons. Significantly different group indicated by orange fill color. Comparison group indicated by “*” and gray fill color.				

Retention comparisons based on age showed students who were 19 or older persisted at rates less than 58 percent. The mean difference between retention of students who were 18 years old and students who were either 1) 19 years old or 2) 20 years old or older was statistically significant (see Appendix: ANOVA Tables). Comparisons based on what region the student came from showed that only international students (80%) and students from the Mississippi service area (74%) returned at a rate higher than the overall cohort (68%).

⁶ Due to the small number of students with a Hawaiian/Pacific Islander, Native-American, and Unknown IPEDS race/ethnicity, these three subgroups were combined into an “Other” race/ethnicity group.

Finally, for the most part, as high school GPA or ACT Composite score declined, retention also decreased. Students who had a high school GPA ranging between 3.01-3.5 or lower persisted at rates lower than the rate for the overall cohort (68%). Similarly, students who had an ACT Composite score ranging between 21-23 or lower persisted at rates lower than the cohort retention rate (68%). The mean difference between retention of students with a high school GPA of 3.51 or higher in comparison to all other high school GPA groups was statistically significant (see Appendix: ANOVA Tables). The mean difference between retention of students with an ACT Composite score of 18 or lower in comparison to students with an ACT Composite score ranging between 24-26, between 27-29, or ACT Composite score of 30 or higher was also statistically significant.

Environmental Variable Cross Tabular Results

For the environmental variables included in this analysis, persistence rates illustrated that receiving scholarships positively affected retention (see Table 2). Students receiving a freshman scholarship (78%) or other scholarship⁷ (71%) persisted at rates higher than the cohort retention rate (68%). Additionally, the mean difference between students who received a freshman scholarship compared to students who did not receive a freshman scholarship was statistically significant (see Appendix: Independent T-Test Tables). Similarly, the mean difference between students who received some other type of scholarship compared to students who did not receive this other type of scholarship was statistically significant.

Table 2: Comparisons of Environmental Variables to Fall 2012 Cohort Retention Rate

Variable	Retention Rate >= 68%	Count	Retention Rate < 68%	Count
<i>*Freshman Scholarship</i>				
	*Yes (78%)	894	No (58%)	992
<i>*Other Scholarship</i>				
	*Yes (71%)	220	No (67%)	1,666
<i>*Housing</i>				
	*On campus (69%)	1,006	Off campus (66%)	880
<i>*Learning Community</i>				
	*Yes (74%)	717	No (64%)	1,169
<i>*Freshman Seminar</i>				
	*Yes (69%)	1,233	No (65%)	653
<i>College⁸</i>				
	Allied Health (71%)	367	Nursing (67%)	278
	Arts & Sciences (68%)	665	Education (67%)	123
	Business (68%)	138	Engineering (64%)	230
			Computing (64%)	84
<i>*Orientation Session</i>				
	Summer Session 1 (79%)	280	Summer Session 5 (64%)	298
	Summer Session 2 (76%)	276	Summer Session 6 (56%)	249
	Summer Session 4 (72%)	283	*August/Adult/Transfer Sessions (44%)	160
	May Session (72%)	69		
	Summer Session 3 (71%)	271		
Note: *Significant mean difference at .05 p level based on Independent T-Test for two group comparisons or at least one group with significant mean difference at .05 p level based on Games-Howell procedure for multiple group comparisons. Significantly different group indicated by orange fill color. Comparison group indicated by "*" and gray fill color.				

Students who lived on campus (69%), participated in a learning community (74%), and who took freshman seminar (69%) persisted at a higher rate than the cohort retention rate (68%). In all of these

⁷ Other scholarship includes third party private scholarships that are not considered a USA Freshman scholarship.

⁸ Continuing Education retention is not reported since there was only one student from Continuing Education in this cohort.

three comparisons, the mean difference between retention of 1) students who lived on campus and students who did not live on campus, 2) students who participated in a learning community and students who did not participate in a learning community, and 3) students who took Freshman Seminar and students who did not take Freshman Seminar was statistically significant (see Appendix: Independent T-Test Tables).

Retention comparisons based on the college housing the major the student initially selected showed only Allied Health (71%) students persisted at a higher rate than the overall cohort (68%). However, no college based comparison was statistically significant (see Appendix: ANOVA Tables).

Finally, in terms of the orientation session attended, persistence rates of students who attended the May Orientation session or one of the first four Freshman Summer orientation sessions were higher than the persistence rate of the overall cohort (68%). Persistence rates based on the orientation session attended ranged from a high of 79 percent for students who attended the Freshman Session one orientation to a low of 44 percent for students who attended either the August, Adult, or a Transfer⁹ orientation session. When using the students who attended either the August, Adult, or a Transfer orientation session as a comparison group, there was a significant mean difference between the August, Adult, or Transfer orientation session group in comparison to the May Orientation session and the first five Freshman Summer orientation sessions (see Appendix: ANOVA Tables).

Outcome Variable Cross Tabular Results

The outcome variables incorporated into this analysis included the number of hours earned through Summer 2013 at USA and the USA GPA through Summer 2013. Unsurprisingly, as the number of USA hours earned increased the persistence rate also increased (see Table 3). Similarly, students with a higher USA GPA were more likely to return than students with a lower USA GPA.

Table 3: Comparisons of Outcome Variables to Fall 2012 Cohort Retention Rate

Variable	Retention Rate >= 68%	Count	Retention Rate < 68%	Count
<i>*USA Hours Earned</i>				
	*30.5 or more (95%)	627	12.5-18 (40%)	171
	24.5-30 (85%)	433	6.5-12 (19%)	160
	18.5-24 (75%)	274	0-6 (7%)	185
<i>*USA GPA</i>				
	3.51-4.0 (94%)	336	*2.0 or lower (31%)	508
	3.01-3.5 (87%)	386		
	2.51-3.0 (78%)	340		
	2.01-2.5 (74%)	280		
Note: *At least one group with significant mean difference at .05 p level based on Games-Howell procedure for multiple group comparisons. Significantly different group indicated by orange fill color. Comparison group indicated by "*" and gray fill color.				

Students who completed 18.5-24 or more hours at USA through Summer 2013 persisted at a higher rate (at least 75%) compared to students completing 12.5-18 or fewer hours (at most 40%). The mean difference for students who completed 30.5 or more hours at USA compared to students in all other USA hours earned groups was statistically significant (see Appendix: ANOVA Tables).

Students with a USA GPA ranging between 2.01-2.5 or higher through Summer 2013 persisted at a higher rate (at least 74%) than the cohort rate (68%) while students with a USA GPA of 2.0 or lower

⁹ Ten students attended the Adult orientation session or one of three Transfer orientation sessions held in the evening to accommodate adult/working students. As with previous freshman cohort retention reports, the retention results for students who attended one of these orientation sessions were combined for this analysis.

persisted at a much lower rate (31%). Furthermore, the mean difference for students who had a USA GPA of 2.0 or lower compared to students in all other USA GPA groups was statistically significant (see Appendix: ANOVA Tables).

Logistic Regression Results

The focus of the study was to determine which student characteristics (inputs) and environmental characteristics (institutional/other support characteristics) can be used to best predict the persistence of USA freshmen students. Since the focus of this study was prediction and classification of a dichotomous outcome variable, stepwise logistic regression was used. This technique allows for the identification of significant variables that contribute to the classification of individuals by using an algorithm to determine the importance of predictor variables. Stepwise logistic regression was used to identify significant variables in the model for predicting the outcome variable. Results of the final step for the model are reported including the classification rate for the model. Additionally, an analysis of the proportionate change in odds for significant variables is provided.

As a part of this study, three logistic models were tested. The first model included the input variables. The second model included the input variables and the environmental variables. The third model tested the outcome variables which were number of USA hours earned through Summer 2013 and USA GPA through Summer 2013 to see what happened when these outcomes were used as predictors of retention.

The number of students (selected cases) included in each model varied based on what variables were included in the final model. Some students in the cohort had missing data, typically high school GPA and/or ACT Composite score. Because complete cases were required to compute the results, the final number of students used for each model ranged from a low of 1,738 students for the first and second models to a high of 1,850 students for the third model. The retention rate for this subset of 1,738 students was 69 percent. With a similar retention rate (69% compared to 68%) and 1,738 students representing 92 percent of the entire cohort, the models tested provided a solid representation of retention for this population. Since the focus for the models tested was to predict *returning* students, the outcome was coded with students not returning as a “0” and students *returning* as a “1”. This focus meant results would predict the odds of whether the student would *return* one year later.

Model 1: Logistic Regression with Input Variables Only

The first model consisted of four steps (see Table 4). The final step (step 4) of the first model showed the model correctly classified students in this cohort who *returned* 91.1 percent of the time and students who did not return 19.0 percent of the time for an overall classification rate of 68.8 percent.

Table 4: Input Model Classification Table^a

Observed			Predicted		
			Returned		Percentage Correct
			No	Yes	
Step 1	Returned	No	31	506	5.8
		Yes	28	1173	97.7
	Overall Percentage				
Step 2	Returned	No	110	427	20.5
		Yes	108	1093	91.0
	Overall Percentage				
Step 3	Returned	No	87	450	16.2
		Yes	64	1137	94.7
	Overall Percentage				
Step 4	Returned	No	102	435	19.0
		Yes	107	1094	91.1
	Overall Percentage				

a. The cut value is .500

For each variable included in the first model, a comparison group was selected (gender=male, race/ethnicity=White, age=20 years or older, region=Florida service area, high school GPA=2.5 or lower, and ACT Composite score=18 or lower). Values greater than “1” (Exp *B*) indicated the odds of the outcome (student *returning*) were higher compared to the selected comparison group. Values less than “1” indicated the odds of the outcome (student *returning*) were lower compared to the selected comparison group.

In the first model (see Table 5), high school GPA, gender, race/ethnicity, and ACT Composite score were significant in the final step of the model (step 4). The final step of the model showed the odds (Exp *B*) of a student *returning* were greater for students with a higher high school GPA (3.01-3.5=1.814 and 3.51-4.0=4.077) than for students with a high school GPA of 2.5 or lower. Additionally, the confidence intervals (95%) indicated that except for students with a high school GPA of 2.51-3.0 (CI=.632-1.964), the odds of a student *returning* were greater for students with a higher high school GPA than for students with a high school GPA of 2.5 or lower since the confidence intervals did not encompass an odds value less than one (3.01-3.5 CI=1.042-3.156 and 3.51-4.0 CI=2.301-7.222).

Constant	-.640	.321	3.977	1	.046	.527		

a. Variable(s) entered on step 1: HS GPA.

b. Variable(s) entered on step 2: Gender.

c. Variable(s) entered on step 3: Race.

d. Variable(s) entered on step 4: ACT.

When looking at the gender of the student, the final step (step 4) of the first model showed the odds (Exp *B*) of a student *returning* were greater for female students (1.380) than for male students. The confidence intervals (95%) also supported this finding that the odds of a female student *returning* were greater than for male students since the confidence intervals did not encompass an odds value less than one.

A review of the final step (step 4) results of the first model for the race/ethnicity of the student showed the odds (Exp *B*) of a student *returning* were greater for Asian (2.362) students and African-American (1.599) students than for White students. In addition, the confidence intervals (95%) indicated that the odds of a student *returning* were greater for Asian (CI=1.107-5.039) students and African-American (CI=1.194-2.141) students than for White students since the confidence intervals did not encompass an odds value less than one.

In terms of the ACT Composite score of the student, the final step (step 4) of the first model showed the odds (Exp *B*) of a student *returning* were greater for students with an ACT Composite score of 24-26 (2.006) and ACT Composite score of 27-29 (1.638) than for students with an ACT Composite score of 18 or lower. Additionally, the confidence intervals (95%) indicated that the odds of a student *returning* were greater for students with an ACT Composite score of 24-26 (CI=1.324-3.040) and ACT Composite score of 27-29 (CI=1.008-2.662) than for students with an ACT Composite score of 18 or lower since the confidence intervals did not encompass an odds value less than one.

Model 2: Logistic Regression with Input and Environmental Variables

The second model included the input and also the environmental variables. For each environmental variable included in the second model a comparison group was selected (whether the student received a freshman scholarship=no, whether the student received an “other” scholarship=no, whether the student lived on or off campus=off campus, whether the student participated in a learning community=no, whether the student took Freshman Seminar=no, which college housed the major the student selected at initial enrollment=Arts & Sciences, and orientation session attended=August, Adult, or a Transfer orientation session).

The second model consisted of two steps (see Table 6). In comparison to the first model, the correct classification rate for the second model increased to 91.4 percent for *returning* students while the classification rate for the second model increased to 23.5 percent for students who did not return. The overall correct classification rate for the second model was 70.4 percent.

Table 6: Input and Environmental Model Classification Table^a

Observed			Predicted		
			Returned		Percentage Correct
			No	Yes	
Step 1	Returned	No	123	414	22.9
		Yes	103	1098	91.4
	Overall Percentage				70.3
Step 2	Returned	No	126	411	23.5
		Yes	103	1098	91.4
	Overall Percentage				70.4

a. The cut value is .500

Once again, high school GPA, gender, race/ethnicity, and ACT Composite score were included in the final step (step 2) of the second model (see Table 7). In addition, orientation session and freshman scholarship were included in the final step of the second model (step 2).

Table 7: Input and Environmental Model Final Variables in the Equation

	B	S.E.	Wald	df	Sig.	Exp(B)	95% C.I. for EXP(B)	
							Lower	Upper

Constant	-1.386	.390	12.656	1	.000	.250		

a. Variable(s) entered on step 1: Orientation.

b. Variable(s) entered on step 2: Freshman Scholarship.

The final step (step 2) of the second model showed that except for students with a high school GPA of 2.51-3.0 (.935) the odds (Exp B) of a student *returning* were greater for students with a higher high school GPA (3.01-3.5=1.383 and 3.51-4.0=2.871) than for students with a high school GPA of 2.5 or lower. However, the confidence intervals (95%) only showed that the odds of a student *returning* were greater for students with a high school GPA of 3.51-4.0 (CI=1.574-5.234) than students with a high school GPA of 2.5 or lower, because the confidence intervals did not encompass an odds value less than one.

When looking at the gender of the student, the final step (step 2) of the second model showed the odds (Exp B) of a student *returning* were greater for female students (1.355) than for male students. The confidence intervals (95%) also supported this finding because the odds of a female student *returning* were greater than for male students since the confidence intervals did not encompass an odds value less than one.

A review of the final step (step 2) results of the second model for the race/ethnicity of the student showed the odds (Exp B) of a student *returning* were greater for Asian (2.675) students and African-American (1.874) students than for White students. In addition, the confidence intervals (95%) indicated that the odds of a student *returning* were greater for Asian (CI=1.225-5.838) students and African-American

(CI=1.386-2.535) students than for White students since the confidence intervals did not encompass an odds value less than one.

In terms of the ACT Composite score of the student, the final step (step 2) of the second model showed the odds (Exp *B*) of a student *returning* were greater for students with an ACT Composite score of 19-20 (1.248), ACT Composite score of 21-23 (1.084), and ACT Composite score of 24-26 (1.299) than for students with an ACT Composite score of 18 or lower. However, when comparing all of the ACT Composite score groups to an ACT Composite score of 18 or lower, none of the comparisons were significant. All of the ACT Composite score group comparisons to an ACT Composite score of 18 or lower encompassed an odds value of one suggesting that ACT Composite score could have been excluded from this second model.

In relation to the orientation session attended, the final step (step 2) of the second model showed the odds of a student *returning* were the greatest for students attending the earlier Freshman Summer orientation sessions. Students attending the earlier orientation sessions had greater odds for *returning* than a student who attended either the August, Adult, or a Transfer orientation session (May=4.231, Summer 1=3.774, Summer 2=3.661, Summer 3=2.928, Summer 4=2.830, Summer 5=2.324, and Summer 6=1.782). In addition, the confidence intervals (95%) supported this finding because in all cases the odds of a student *returning* for students attending the earlier Freshman Summer orientation sessions were greater than for students who attended either the August, Adult, or a Transfer orientation session since the confidence intervals did not encompass an odds value less than one.

Lastly, when considering the impact of freshman scholarships, the final step (step 2) of the second model showed the odds (Exp *B*) of a student *returning* were greater for students who received a freshman scholarship (1.701) than for students who did not receive a freshman scholarship. The confidence intervals (95%) also supported this finding because the odds for students *returning* who received a freshman scholarship were greater than for students who did not receive a freshman scholarship since the confidence intervals did not encompass an odds value less than one.

Model 3: Logistic Regression with Outcome Variables Only

Since outcomes of student success are different from inputs (student characteristics or institutional/other support characteristics), the third model only included the outcomes of interest: number of hours earned through the Summer of 2013 and the USA GPA the student attained through the Summer of 2013. The first and second models can be used based on data known before or at least early on after the student comes to campus. However, this third model can only be used after Summer 2013 has ended.

For the third model a comparison group was selected for the number of hours earned and the USA GPA the student attained through the Summer of 2013 (number of hours earned=0-6 hours and USA GPA=2.0 or lower). The third model (see Table 8) consisted of two steps. Compared to the second model, the correct classification rate for the third model was slightly lower (91.3) for *returning* students. However, in comparison to the other two models, the correct classification rate of the third model dramatically increased to 69.5 percent for students who did not return since this snapshot was based on data representing Summer 2013 student success outcomes instead of pre-Fall 2012 student characteristics and institutional or other support characteristics. The overall correct classification rate for the third model was 84.6 percent.

Table 8: Outcome Model Classification Table^a

Observed			Predicted		
			Returned		Percentage Correct
			No	Yes	
Step 1	Returned	No	404	166	70.9
		Yes	112	1168	91.3
	Overall Percentage				85.0
Step 2	Returned	No	396	174	69.5
		Yes	111	1169	91.3
	Overall Percentage				84.6

a. The cut value is .500

In the final step (step 2) of the third model, both the hours earned at USA and USA GPA variables were significant (see Table 9). The final step (step 2) of the third model showed the odds (Exp *B*) of a student *returning* were greater for students with more hours earned (6.5-12=3.164, 12.5-18=8.511, 18.5-24=40.704, 24.5-30=71.748, 30.5 or more=205.027) than for students with six or fewer hours earned by Summer 2013. Furthermore, confidence intervals (95%) for all USA hours earned comparison groups did not encompass an odds value less than one.

Table 9: Outcome Model Final Variables in the Equation

		B	S.E.	Wald	Df	Sig.	Exp(B)	95% C.I. for EXP(B)	
								Lower	Upper
Step 1 ^a	USA Hours Earned 0-6			510.824	5	.000			
	USA Hours Earned 6.5-12	1.157	.350	10.900	1	.001	3.179	1.600	6.318

	USA Hours Earned 18.5-24	3.671	.320	132.013	1	.000	39.309	21.013	73.534
	USA Hours Earned 24.5-30	4.316	.318	184.749	1	.000	74.907	40.199	139.579
	USA Hours Earned 30.5 or more	5.505	.340	262.036	1	.000	246.010	126.316	479.121
	Constant	-2.583	.288	80.611	1	.000	.076		
Step 2 ^b	USA Hours Earned 0-6			270.674	5	.000			
	USA Hours Earned 6.5-12	1.152	.353	10.658	1	.001	3.164	1.585	6.317
	USA Hours Earned 12.5-18	2.141	.337	40.492	1	.000	8.511	4.401	16.460
	USA Hours Earned 18.5-24	3.706	.346	114.768	1	.000	40.704	20.661	80.190
	USA Hours Earned 24.5-30	4.273	.368	134.718	1	.000	71.748	34.868	147.634
	USA Hours Earned 30.5 or more	5.323	.398	178.820	1	.000	205.027	93.967	447.353
	USA GPA 2.0 or lower			9.909	4	.042			
	USA GPA 2.01-2.5	.023	.219	.011	1	.917	1.023	.665	1.573
	USA GPA 2.51-3.0	-.252	.231	1.184	1	.277	.777	.494	1.224
	USA GPA 3.01-3.5	.081	.254	.101	1	.751	1.084	.659	1.783
	USA GPA 3.51-4.0	.659	.315	4.381	1	.036	1.932	1.043	3.580
Constant	-2.580	.288	80.456	1	.000	.076			

a. Variable(s) entered on step 1: USA Hours Earned.

b. Variable(s) entered on step 2: USA GPA.

The final step (step 2) of the third model showed the odds (Exp *B*) of a student *returning* were greater for students with a USA GPA of 3.51-4.0 (1.932) at the end of Summer 2013 than for students with a USA GPA of 2.0 or lower at that same time. The confidence intervals (95%) also supported this finding because the odds of students with a USA GPA of 3.51-4.0 *returning* were greater than for students with a USA GPA of 2.0 or lower since the confidence intervals did not encompass an odds value less than one.

Peer Comparisons

Finally, to gain a better idea about how USA retention rates compared to retention at peer institutions, the National Center for Education Statistics (NCES) Integrated Postsecondary Education Data System (IPEDS) Data Center was used to compare retention rates at USA to 47 peer institutions (see Table 10). A five year retention rate trend based on the latest available retention rate data in IPEDS showed USA had lower retention rates than most peer institutions over this five year time period. The USA retention rate over this five year time period ranged from a low of 65% for the 2010 freshman cohort to a high of 70% for the 2006 freshman cohort. The retention rate of peer institutions over this five year time period ranged from a low of 50% for the Auburn University at Montgomery 2010 freshman cohort to a high of 94% for the University of Georgia 2008, 2009, and 2010 freshman cohorts.

Table 10: Five Year Retention Rate Peer Comparisons * Ranked by 2010 Cohort Retention Rate * High to Low

Implications

Based on what we know about a student before the student steps foot on campus (input variables), retention of students with lower high school GPAs and students with lower ACT Composite scores is a concern. This prompts further reflection regarding admission standards and the allocation of resources to support at risk students.

When we look at the institutional support and other support provided to a student (environmental variables), just like with the Fall 2007, Fall 2008, Fall 2009, Fall 2010, and Fall 2011 cohorts, the orientation session students in the Fall 2012 cohort attended provided a significant predictor of student persistence, with students attending the earlier Freshman Summer orientation sessions more likely to persist than students attending the later orientation sessions. The orientation session attended by students continues to provide a key factor for identifying at-risk freshmen students early in their college experience.

Previous IRPA studies have looked at the contribution of freshman scholarships to recruitment and retention goals. As with earlier studies, the importance of awarding freshman scholarships for students was clear. Additional freshman scholarships should also be considered in order to attract top students to the institution since the data suggests students with freshman scholarships are also very likely to return to continue their studies at USA the following year.

This annual retention study also compared retention of freshmen who participated in a learning community to freshmen who did not participate in a learning community in his/her first Fall semester at USA. Freshmen who participated in a learning community were significantly more likely to return to USA the following year. Additionally, freshmen who took Freshman Seminar or who lived on campus were also significantly more likely to return to USA. Learning communities typically include a Freshman Seminar and are required in some cases, depending on the residence hall, for students who live on campus. Therefore, expanding the number of learning communities for freshmen to participate in should also receive further consideration.

Future Retention Research

This report is the first of two retention studies about the Fall 2012 freshman cohort that will be completed by Institutional Research, Planning & Assessment during the Fall 2013 semester. The second retention study will use National Student Clearinghouse data to explore the issue of “Where did USA Fall 2012 freshmen non returning students go?” This study will determine how many non returning freshmen students transferred to another college or university or “stopped out” of college altogether.
